Materials

The MAGRIS chains are produced with high quality steel/stainless steel in order to satisfy the growing needs of technological progress in the conveyor sector.

SLATS

Hard Inox

Special work hardened, chrome-nickel, highly wear and corrosion resistant stainless steel. It has excellent mechanical characteristics and exceptional sliding properties, due to a very low surface roughness.

It is particularly suitable for the critical points of the bottling lines.

Material used for the Super, Flex RXMS, Flex FMS, Flex FMS2, New Flex Mag, Super-G, Flex RXMS-G, New Flex Mag-G models.

Inox

Ferritic, AISI 430 stainless steel, work hardened by cold-rolling, with good corrosion resistance. It has an excellent surface finishing with low roughness, a remarkably important quality for the sliding of the conveyed products.

It is used in standard bottling industry applications.

Material used for the Special, Standard, Flex RXMC models.

HQ Inox (high quality)

Special, new, chrome-nickel (W.1.4589) stainless steel, work hardened. It has been developed in cooperation with a major stainless steel manufacturer for very special applications such as pressureless combiners/inliners. Cold rolled to extremely high quality standards, this new material has unique features:

- exceptional surface finishing and flatness;
- very high working load and wear resistance.

The right answer to the most sophisticated needs.

Material used for the Superspeed, Wear-Proof, Flex FMD, New Flex Mag-D models.

Inox 18/8

Austenitic and non-magnetic AISI 304 stainless steel (18% Chrome - 8% Nickel), work hardened for high resistance.

It provides excellent resistance to chemical agents and corrosion.

It has excellent mechanical and duration characteristics.

It is particularly used in the preservation and bottling industry.

Material used for the Stella D., Flex RXM, Flex FM, Flex FM2 models.

*** Approved by the Food and Drug Administration (FDA), American Government Organization for the direct contact with foodstuffs.

Inox 316

Austenitic AISI 316L stainless steel (18% Chrome - 14% Nickel - 3% Molybdenum).

It is used with chemical agents and strong acids.

Material used for the 316, Flex RXM 316 models.

Carbon Steel

Heat-treated carbon steel with a surface and core hardness of 43 HRC. It is particularly suitable for high working loads and is highly resistant to wear.

It is used in the glass, ceramic and general product conveying industry.

Material used for the Accate, Flex RXMA models.

*** For difficult applications and with abrasive dust, upon request, the Carbon Steel can be case hardened, reaching a surface hardness of 55 HRC and a core hardness of 40 HRC.

PINS

In the Special, Standard, Super, Super-G, Stella D., Flex RXMC, Flex RXMS, Flex RXMS-G, Flex FMS, Flex FMS2, Flex RXM, Flex FM, Flex FM2 models the pins are made of austenitic stainless steel (18% Chrome - 8% Nickel), work hardened for high resistance.

In the Wear-Proof, Superspeed, Flex FMD, New Flex Mag, New Flex Mag-D, New Flex Mag-G models the pins are made of magnetic stainless steel AISI 431, 400 series, work hardened for high resistance.

In the 316, Flex RXM 316 models the pins are made of austenitic AISI 316 stainless steel.

In the Accate, Flex RXMA models the pins are made of case hardened carbon steel.

N.B.: Upon request, we can produce all our chains with other types of stainless steel.

Chain sizing

according to the maximum allowable working load method

Chain sizing consists of a comparison between the chain tension at headshaft, which a chain is subject to, and the maximum allowable working load of the chain itself. The following formulas allow an evaluation of the chain tension at headshaft as a function of the different load conditions.

Symbols

F_t	Chain tension at headshaft (N)
F_o	Chain tension on return track (N)
F_1, F_2, \dots	Sum of all loads (N)
W_c	Chain weight (Kg/m)
W_m	Conveyed product weight (Kg/m)
L	Horizontal conveyor length (metres)
L_1, L_2, \dots	Conveyor track length (metres)
H	Vertical conveyor elevation (metres)
L_s	Conveyor length of the section where accumulation occurs (metres)
L_{1s}, L_{2s}, \dots	Conveyor length of the section where accumulation occurs (metres)
R	Curve radius (metres)
α	Bending angle (degrees)
K	Length factor (table D)
T	Curve factor (table E)
f_1	Friction factor between chain and wear strips (table A)
f_2	Friction factor between chain and conveyed products (table A)
f_p	Start up factor (table B)
S	Slippage factor (table C)
9.81	Gravity acceleration (m/s ²)

Chain materials: carbon steel and stainless steel

A	f_1		f_2		
	Friction factor between chain and wear strips		Friction factor between chain and conveyed products		
Lubrication used	Steel	High density polyeth. and nylon	Cardboard, plastic	Metal	Glass, Ceramic

Conveyors with straight running chains

Horizontal conveyor

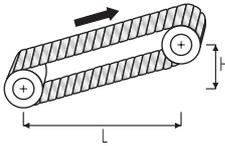

Without accumulation

$$F_t = (2W_c + W_m) \times L \times f_1 \times f_p \times 9,81$$

With accumulation

$$F_t = [(2W_c + W_m) \times L \times f_1 \times f_p + L_s \times W_m \times f_2 \times S] \times 9,81$$

Inclined conveyor

Without accumulation

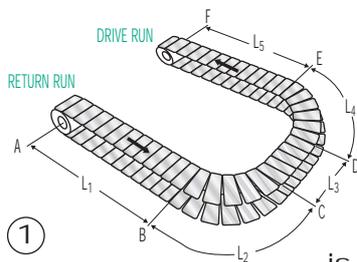

$$F_t = [(2W_c + W_m) \times L \times f_1 \times f_p + (W_c + W_m) \times H] \times 9,81$$

With accumulation

$$F_t = [(2W_c + W_m) \times L \times f_1 \times f_p + (W_c + W_m) \times H + L_s \times W_m \times f_2 \times S] \times 9,81$$

Conveyors with sideflexing chains

In this case the calculation of the chain tension at headshaft is carried out as the sum of successive loads (fig. 1):

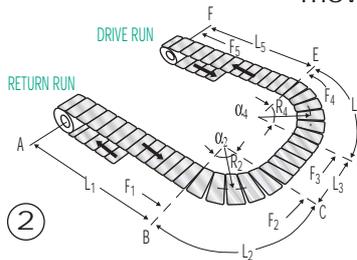

$$L_2 = K(\alpha_2) \times R_2$$

$$L_4 = K(\alpha_4) \times R_4$$

1- Return run

The evaluation of the chain tension in the return run is carried out by starting at the driven sprocket following the movement of the chain itself up to the return sprocket (fig. 2):

$$\text{Track FE} \quad F_5 = W_c \times L_5 \times f_1$$

$$\text{Track FD} \quad F_4 = [F_5 + W_c \times L_4 \times f_1] \times T(\alpha_4)$$

$$\text{Track FC} \quad F_3 = F_4 + W_c \times L_3 \times f_1$$

$$\text{Track FB} \quad F_2 = [F_3 + W_c \times L_2 \times f_1] \times T(\alpha_2)$$

$$\text{Track FA} \quad F_1 = F_2 + W_c \times L_1 \times f_1$$

$$F_0 = F_1 \times f_p \times 9,81$$

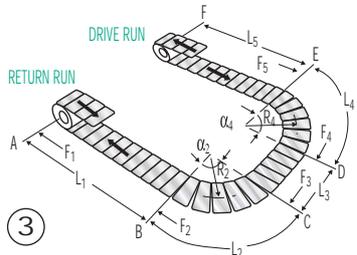

Written in a more explicit manner:

$$F_0 = \{[(L_5 + L_4) \times W_c \times f_1 \times T(\alpha_4) + (L_3 + L_2) \times W_c \times f_1] \times T(\alpha_2) + L_1 \times W_c \times f_1\} \times f_p \times 9,81$$

2- Drive run

• Chain tension at headshaft without accumulation •

The evaluation of the chain tension in the conveying run is carried out by starting from the return sprocket following the movement of the chain itself up to the drive sprocket (fig. 3):

$$\text{Track AB} \quad F_1 = F_0 + (W_c + W_m) \times L_1 \times f_1 + f_p \times 9,81$$

$$\text{Track AC} \quad F_2 = [F_1 + (W_c + W_m) \times L_2 \times f_1 + f_p \times 9,81] \times T(\alpha_2)$$

$$\text{Track AD} \quad F_3 = F_2 + (W_c + W_m) \times L_3 \times f_1 + f_p \times 9,81$$

$$\text{Track AE} \quad F_4 = [F_3 + (W_c + W_m) \times L_4 \times f_1 + f_p \times 9,81] \times T(\alpha_4)$$

$$\text{Track AF} \quad F_5 = F_4 + (W_c + W_m) \times L_5 \times f_1 + f_p \times 9,81$$

• Chain tension at headshaft with accumulation •

The component of the chain tension at headshaft due to the accumulation of material conveyed is evaluated by starting from the return sprocket towards the drive sprocket, for the only track involved by the accumulation (fig. 3). In this case the total chain tension at headshaft is given by the sum of the component without accumulation plus the one due to the accumulation of the material:

$$\text{Track AB} \quad F_1 = F_0 + [(W_c + W_m) \times L_1 \times f_1 \times f_p + L_{1s} \times W_m \times f_2 \times S] \times 9,81$$

$$\text{Track AC} \quad F_2 = \{F_1 + [(W_c + W_m) \times L_2 \times f_1 \times f_p + L_{2s} \times W_m \times f_2 \times S]\} \times T(\alpha_2)$$

$$\text{Track AD} \quad F_3 = F_2 + [(W_c + W_m) \times L_3 \times f_1 \times f_p + L_{3s} \times W_m \times f_2 \times S] \times 9,81$$

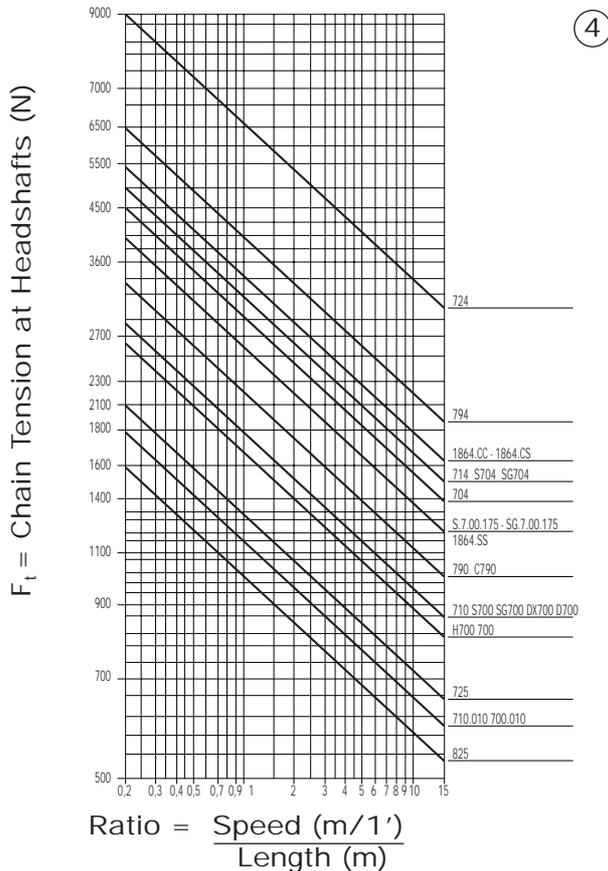

$$\text{Track AE} \quad F_4 = \{F_3 + [(W_c + W_m) \times L_4 \times f_1 \times f_p + L_{4s} \times W_m \times f_2 \times S]\} \times T(\alpha_4)$$

$$\text{Track AF} \quad F_5 = F_4 + [(W_c + W_m) \times L_5 \times f_1 \times f_p + L_{5s} \times W_m \times f_2 \times S] \times 9,81$$

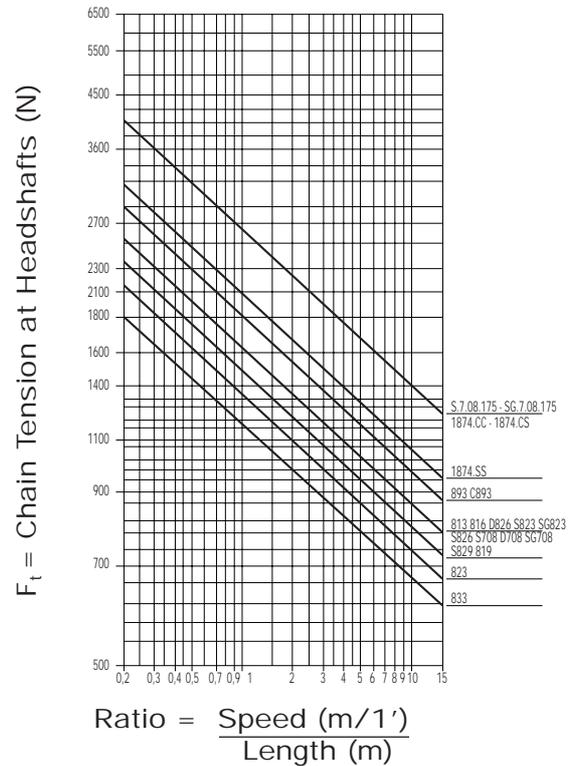

Chain selection

Having evaluated the chain tension at headshaft which the chain is subject to, and calculated the speed/length of the conveyor ratio, the two values are stated in figure 4. The chain suitable for the use in question is the one whose curve is immediately above the intersection of the two values.

Power

The driven sprocket is required the following power:

$$P = \frac{F_t \times v}{6 \times 10^4}$$

where: P = Power (kW), F_t = Chain Tension at Headshaft on the chain (N),
v = Speed (m/min)

Example

The 7.10.040 chain, dry-operating, conveys glass wine bottles. Each bottle weighs 1,5 Kg and they are placed on the chain at 20 cm intervals (5 bottles per metre). The chain stops and restarts 10 times per hour. There is accumulation of the 20% operating time and on a length of 8 metres.

Aims:

- Chain checking;
- Calculation of the power needed by the shaft.

Start up data:

- Conveyor length (L) = 12 m
- Chain weight (W_C) = 2,6 Kg/m
- Conveyed product weight (W_M) = 7,5 Kg/m
- Friction factor (f_1) = 0,20
(table A: chain-polyethylene wear strip)

- Speed (v) = 45 m/min.
- Start up factor (f_p) = 1,7 (table B)
- Slippage time percentage = 20%
- Slippage factor (S) = 0,7 (table C)
- Length with accumulation (L_S) = 8 m
- Friction factor (f_2) = 0,45
(table A: chain-glass bottle)

Calculation of the Chain Tension at Headshaft (F_t)

$$F_t = [(2W_C + W_M) \times L \times f_1 \times f_p + L_S \times W_M \times f_2 \times S] \times 9,81$$

$$= [(2 \times 2,6 + 7,5) \times 12 \times 0,20 \times 1,7 + 8 \times 7,5 \times 0,45 \times 0,7] \times 9,81$$

$$= 693,72 \text{ N}$$

Calculation of the Speed/Length ratio (v/L)

$$v/L = 45/12$$

$$= 3,75 \text{ m/min/m}$$

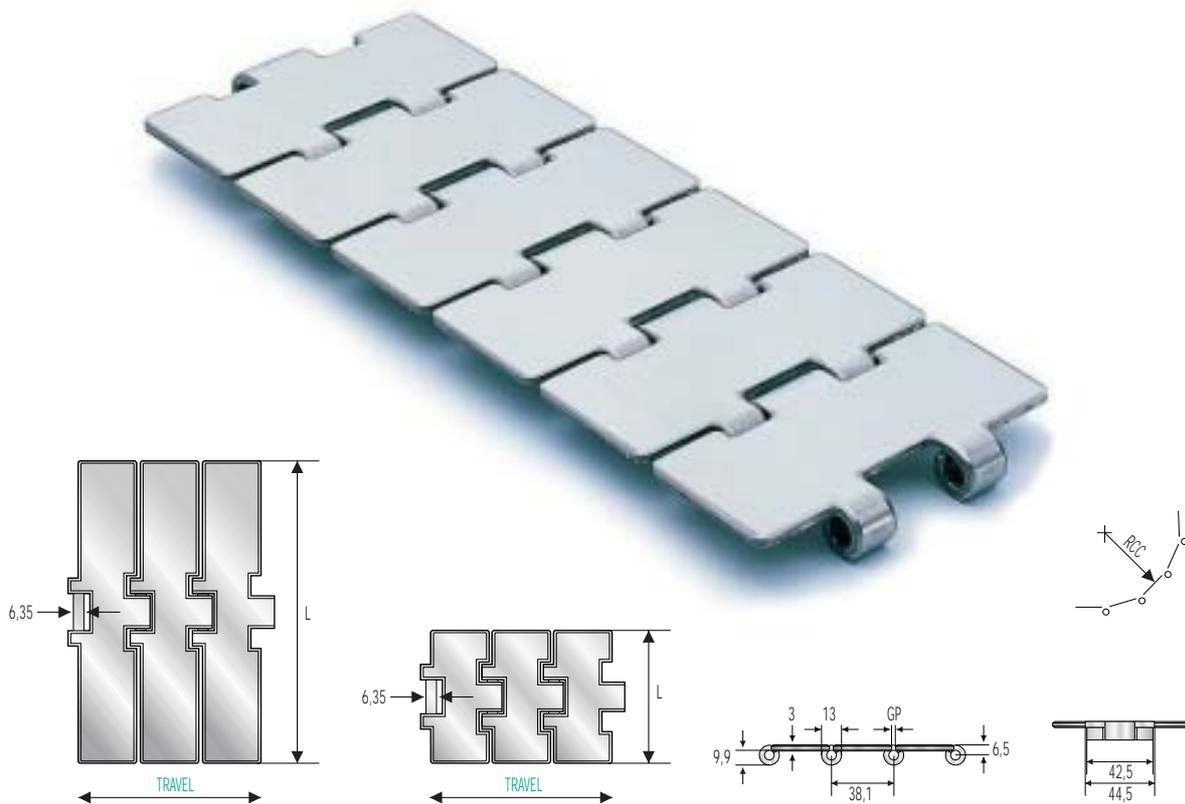

The "allowable working load" diagram shows that the maximum chain tension at headshaft available for that chain and for that speed ratio is 1300 N. The selected chain is therefore suitable for our purpose.

Calculation of Power (P)

$$P = \frac{F_t \times v}{6 \times 10^4} = \frac{693,72 \times 45}{6 \times 10^4} = 0,520 \text{ kW}$$

Straight running hinged slat chains

Straight running hinged slat chains

Super Hard Inox

- Special, chrome-nickel, stainless steel slats, work hardened for high resistance, with shiny surface having a roughness of $R_a \leq 0.3$ microns.
- Chrome-nickel, austenitic stainless steel pins (18% Chrome - 8% Nickel), work hardened for high resistance.

Hinged slat chains - reinforced hinge for sideflexing conveyors on magnetic tracks

Hinged slat chains - reinforced hinge for sideflexing conveyors on magnetic tracks

New Flex Mag

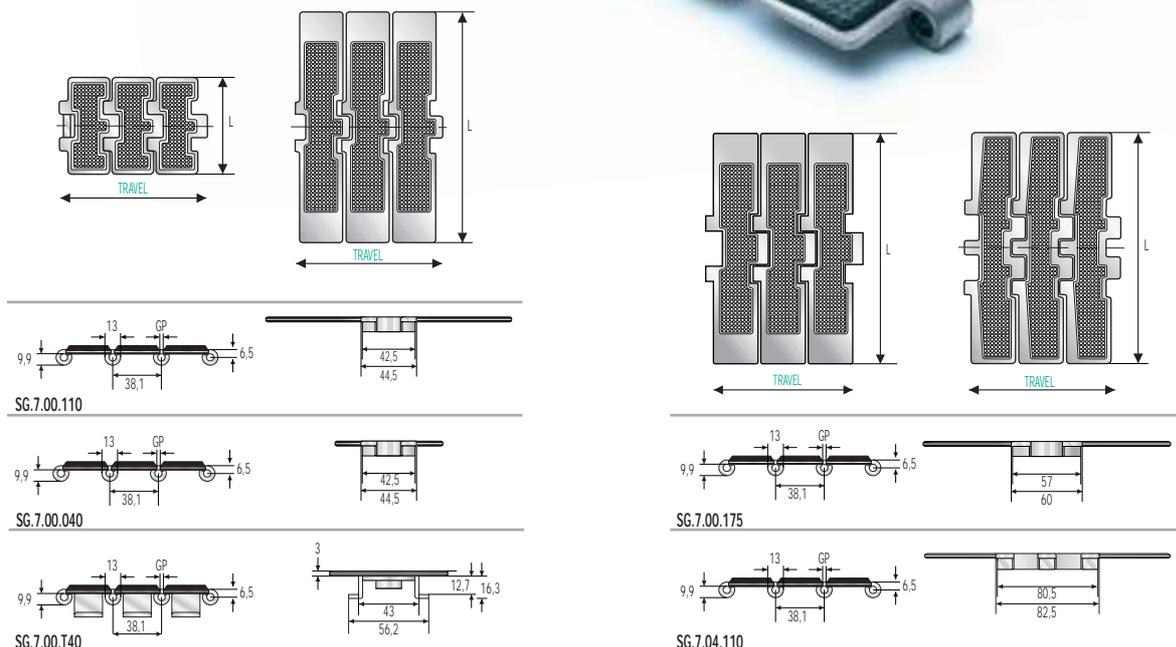

Hard Inox

- Special, chrome-nickel, stainless steel slats, work hardened for high resistance, with shiny surface having a roughness of $R_a \leq 0.3$ microns.
- Special, stainless steel pins, 400 series - magnetic - work hardened for high resistance.

Model	L=Slat width		Code	Chain ref.	R=Minimum sideflexing radius	Weight per metre
	mm	"			mm	Kg/m
New Flex Mag	190,5	7 1/2	S.7.08.175	SSH 8817 M K750	860	5,03

Standard shipping lengths: 80 pitches = 10 feet = 3,048 metres

Hinged slat chains with rubber top for inclined conveyors

Hinged slat chains with rubber top for inclined conveyors

Super-G/DHG

Hard Inox

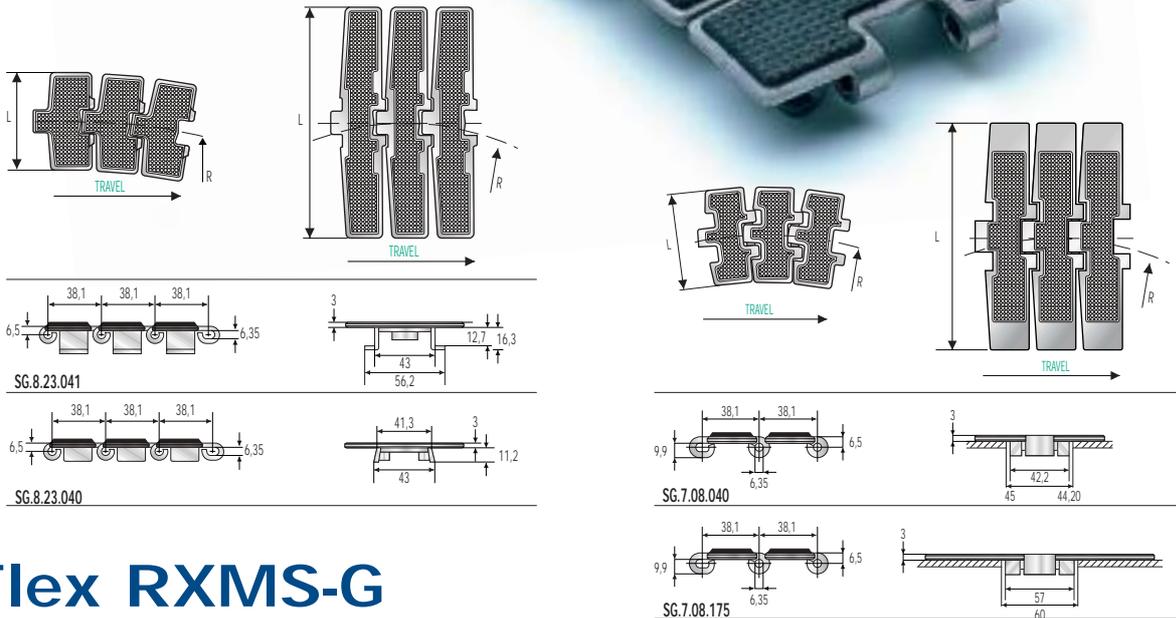

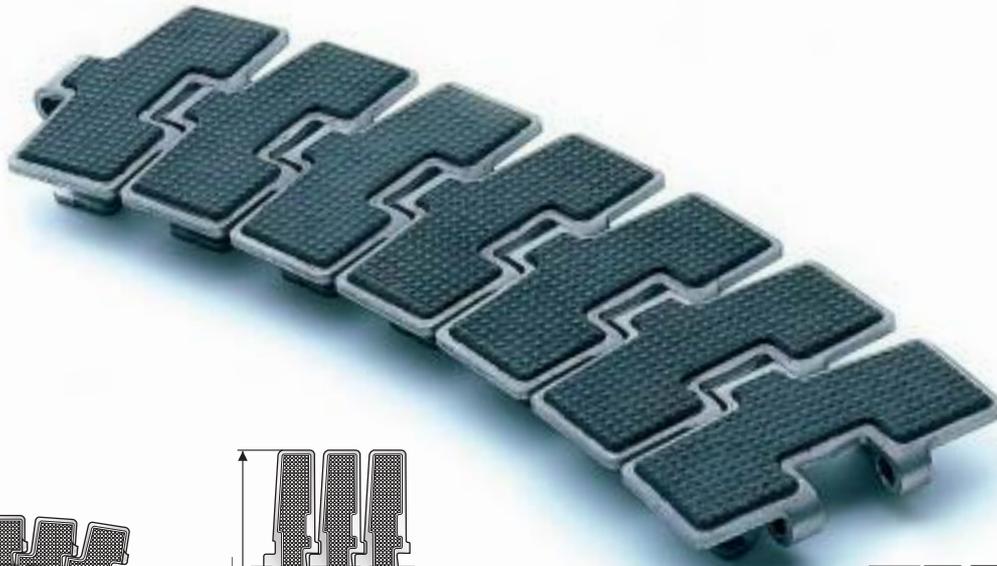

- Special, chrome-nickel, stainless steel slats, work hardened for high resistance, with a rubber insert.
- Chrome-nickel, austenitic stainless steel pins and guide shoes (18% Chrome - 8% Nickel), work hardened for high resistance.

Model	L=Slat width		Code	Chain ref.	Hardness	GP	RCC	Weight per metre

Standard shipping lengths: 80 pitches = 10 feet = 3,048 metres

Block body machined steel sprockets

The sprocket tooth pitch (mm 19,05) is half the pitch of the chain (38,1 mm). Therefore, when a sprocket with an odd number of teeth is used, the teeth engage the chain only every other revolution. This doubles the life of sprockets.

For straight running hinged slat chains and for New Flex Mag - New Flex Mag-D - New Flex Mag-G hinged slat chains

Code	Number of teeth	DE=Outside diameter	Pitch diameter	L=Sprocket width	F=Plain bore diameter	Weight per unit

"1864" Straight running hinged slat chains with base roller chain

"1864" Straight running hinged slat chains with base roller chain

1864

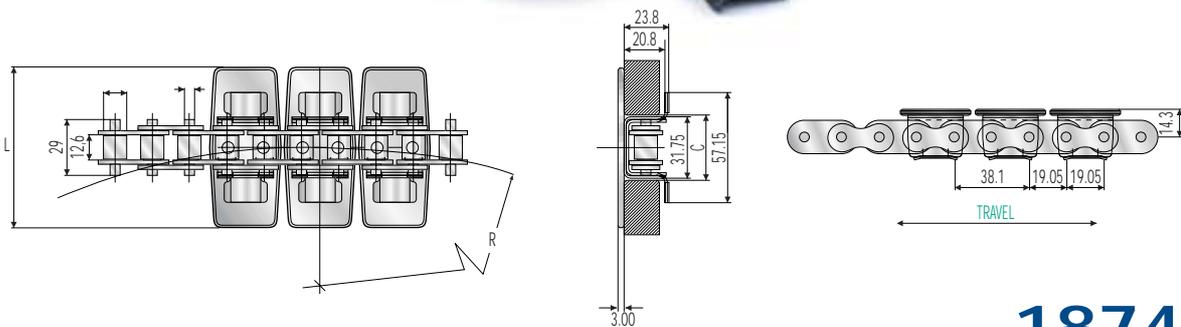

This high speed, high capacity series offers better efficiency and reliability in applications where high temperatures or abrasive materials are involved.

Straight running: steel and stainless steel top plates, 19,05 mm - 3/4" pitch.

The indicated data are approximate as the corrosion resistance of the above-mentioned steel, according to the conditions of use, is related to the work temperature, the concentration of the chemical agent, the duration of the contact with it, etc.
